Interac Corp.
Hiring Team, Fraud Operations, Countermeasures
Toronto, ON

Re: Application for Fraud Operations, Countermeasures, Specialist

When an Interac e-Transfer goes wrong, a Canadian feels it personally, and trust in the rail is the product itself. That is what makes fraud operations at Interac different from fraud operations at a single bank: countermeasures protect a piece of national infrastructure that almost everyone in the country touches, and the trust has to be re-earned on every transaction. That is the team I want to work on, and I am applying with experience that I think translates more directly than my job title suggests.

Fraud operations and my current casework share one core discipline: deciding quickly whether an identity is what it claims to be, and being right enough, consistently enough, that the queue keeps moving without letting bad cases through. At IRCC's Operations Support Centre I make those calls daily on a national intake, cross-referencing biographic, biometric, and travel-document evidence to resolve probabilistic identity matches, and escalating the anomalies that need controlled handling under federal protocols.

I should be candid: my title does not say fraud. The day-to-day does. Identity conflicts, duplicate records, and document evidence that does not line up are my caseload, and I dig into the documents themselves: passports and travel documents, examined with close familiarity with the tactics applicants actually use to try to trick identity systems. Before IRCC, I spent three years as the on-floor KYC and credit decision authority at Rogers, the retail front line against subscription and identity fraud, where I also trained every new hire on verification procedure. Coaching a team to hold a compliance line under volume is something I have done for years, not something I would be trying for the first time.

Where I see myself helping a countermeasures team: working the escalation queue accurately from early on, and then helping measure what the team often has no time to measure. In a concurrent research role I calculated percent agreement and false-positive rates between a real-time detection method and its benchmark, the same analytical shape as evaluating whether a countermeasure is catching fraud or just creating friction. I built that kind of reporting in Excel and Power BI, and I am completing the Google Data Analytics Professional Certificate to push it further.

I support operations across 60+ international sites and time zones today, so always-on environments are familiar. I work in English and Arabic natively with working French, hold an active federal Reliability Status, and am based in Ottawa with genuine flexibility for a hybrid Toronto arrangement. I would be glad to talk through real case patterns in a screen.

Sincerely,

Husam Ahmed
