Canada Mortgage and Housing Corporation
Hiring Team, Analyst, Data Quality
Ottawa, ON

Re: Application for Analyst, Data Quality

Housing decisions in this country run on CMHC's numbers. Market analyses, the Housing Market Information Portal, mortgage insurance operations, and the research behind housing policy all sit on data that someone has to keep clean, consistent, and trustworthy before any of it can be used. A wrong record in a national dataset does not stay contained; it propagates into analysis and into decisions people act on. Data quality is the unglamorous layer everything else depends on, and it happens to be the work I do and like.

My job title says program assistant. My actual day job is data quality on a national system: in IRCC's Global Case Management System I investigate probabilistic identity matches, decide whether records belong to the same person, and commit the master-record corrections that restore integrity, with each correction documented. I work these cases from a national intake queue, so volume, prioritization, and consistency under load are daily realities rather than abstractions. When your posting describes data quality analysis, that is not adjacent to what I do. It is what I do.

The toolset matches too. I run pivot analyses in Excel across large case datasets to confirm statuses and surface anomalies. In a concurrent research role I took inconsistently formatted public data from Health Canada, the US EPA, and provincial reports, standardized it so it could be compared, and built the cross-jurisdictional Power BI dashboards that team prioritized markets by. I also quantified data reliability directly, calculating percent agreement and false-positive rates between a real-time method and its lab benchmark, the same discipline as measuring a dataset against a quality standard rather than assuming it passes.

Where I see myself helping CMHC's team: running the recurring quality checks and reconciliations that keep datasets release-ready, chasing root causes of recurring errors rather than re-fixing symptoms, and documenting quality procedures so they survive staff turnover. I have written SOPs and briefing notes across these roles, so turning findings into something a manager or a data steward can act on is familiar ground.

Where I will be honest about the edges: my stack today is Excel and Power BI, not SQL. I am partway through the Google Data Analytics Professional Certificate, which covers it, and querying is the next tool on my list rather than one I claim now. I am in Ottawa, hold an active Reliability Status from current federal employment, and work in English and Arabic natively with working French. I would welcome the chance to talk through how federal-scale record integrity translates to CMHC's data.

Sincerely,

Husam Ahmed
