Equifax Canada

Hiring Team, Fraud Investigator, Managed Services (j00176117)

Toronto, ON

Re: Application for Fraud Investigator, Managed Services (req j00176117)

Managed Services is a distinctive promise: clients hand Equifax their fraud queues and trust that every decision made in their name will be fast, consistent, and defensible when challenged. Working application-fraud cases inside the company whose data underpins Canadian credit decisions, with that client trust on the line, is a version of investigation work I would take seriously and genuinely enjoy. It is also, in substance, very close to the queue I already work.

Working a fraud queue well means holding two things at once: enough speed that the volume clears, and enough rigor that every decision survives review. That balance is my current job. At IRCC's Operations Support Centre I work a national intake of identity cases, investigating discrepancies across biographic, biometric, and travel-document evidence and committing record corrections with the rationale documented, because in federal casework an undocumented decision does not count.

I should be candid that my title is not fraud investigator. The substance is close: identity conflicts, duplicate and unlinked records, and documents that do not reconcile are what I investigate daily. I examine passports and travel documents directly, I know the tactics applicants use to try to trick identity systems, and the core judgment, distinguishing an innocent mismatch from a real attempt, is the same one application-fraud review runs on. The credit side is not new to me either. For three years at Rogers I was the on-floor authority for credit and KYC decisions, the retail front line against subscription and identity fraud, reviewing documentation and credit-check results before any transaction closed and training new hires to the same standard. I have read credit-check outputs as a decision input for years; reading them from inside the bureau would be a deeper version of a familiar discipline.

Where I see myself helping the Managed Services team: clearing cases at the productivity-and-quality balance the service is sold on, writing the documented rationale that lets a client audit any decision, and contributing to the quality side of the operation. In a concurrent research role I quantified detection quality directly, calculating percent agreement and false-positive rates between a real-time method and its benchmark in Excel pivot tables, and built Power BI reporting on operational data. I am completing the Google Data Analytics Professional Certificate to extend exactly that skill set.

I work in English and Arabic natively with working French, hold an active federal Reliability Status, and am based in Ottawa with flexibility for hybrid arrangements. I would be glad to walk through how I handle a borderline case, end to end, in a screen.

Sincerely,

Husam Ahmed
